Precipitation	WFDEI (0.5° x 0.5°)	Weedon et al. (2014)			
Temperature (mean, min, max)	WFDEI (0.5° x 0.5°)	Weedon et al. (2014)			
Snow cover area	GlobSnow	Luojus et al. (2013)			

Forecasting protocol

EUPORIAS

Projections from System4 (15 members initialised every month) were downloaded, bias corrected using the DBM method, and re-formated for E-HYPE

Bias correction

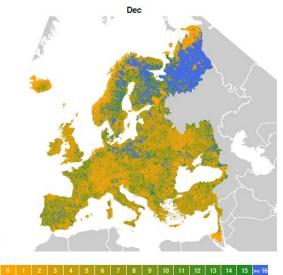

Remaining bias in precipitation validation period (all months and lead months)

Methodology

- **SMHI**
- Evaluation at about 35 400 basins for lead time 0 2 4 months ahead and all 15 ensemble members:
 - Monthly evaluation (in terms of volume)

Performance metric of forecasting system

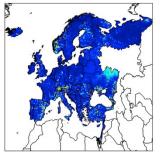

$$beta = 1 - \sqrt{(1 - \frac{\overline{X_F}}{\overline{X_{PO}}})^2}$$

1 indicates perfect representation of monthly volumes

Seasonal hydrological forecasting skill

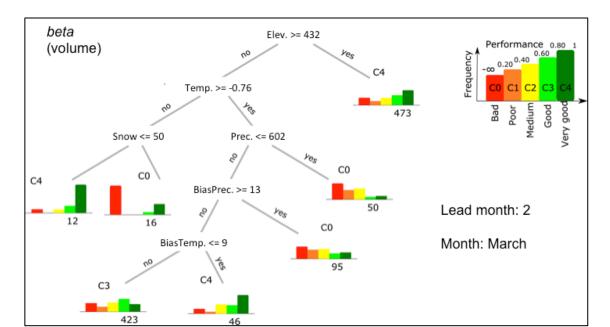

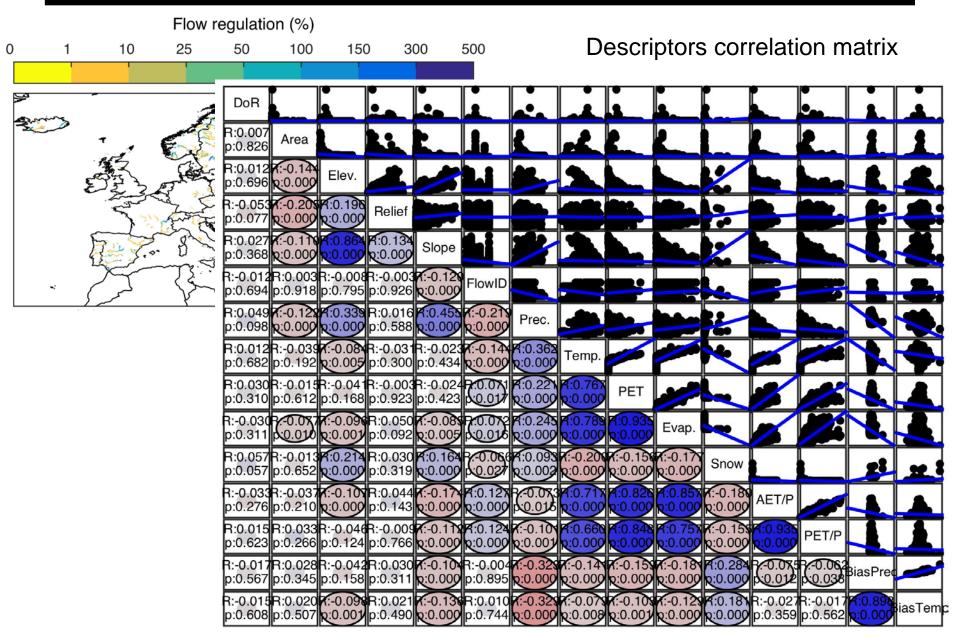

Link skill with physiographic-climatologic characteristics

- □ Classification And Regression Trees (CART)
 - Ranking the physiographic-climatologic characteristics in terms of importance
- □ Characteristics (14 + 12)
 - Climate: Prec., Temp., Snow, AET, PET, AET/P, PET/P
 - o Topography: Area, Elev., Relief, Slope
 - Human impact: Degree of regulation (DoR)
 - o Bias clim. forecasts: Prec., Temp
 - Hydrology: 12 flow signatures

Descriptors

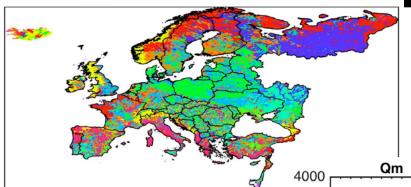

Clusters 5 6 7 8 9 10 11

Flow Info

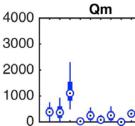

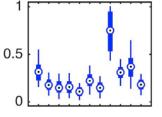

2

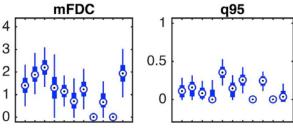

З

Quantify 12 flow signatures based on modelled daily runoff (mm d⁻¹). We then apply a *k*-means clustering within the 12D space to categorise the subbasins based on their combined similarity in flow signatures.

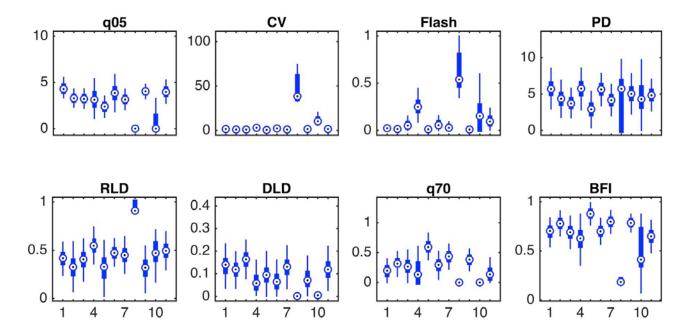

DPar

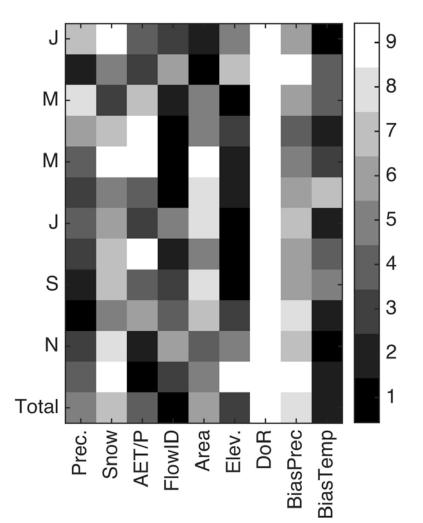

Signature	Abbreviation
Mean annual specific runoff	Qm
Normalised high flow	<i>q</i> 05
Normalised low flow	q95
Normalised relatively low flow	<i>q</i> 70
Slope of flow duration curve	mFDC
Range of Pardé coefficient	DPar
Coefficient of variation	CV
Flashiness	Flash
Normalised peak distribution	PD
Rising limb density	RLD
Declining limb density	DLD
Long-term mean discharge	Qdm

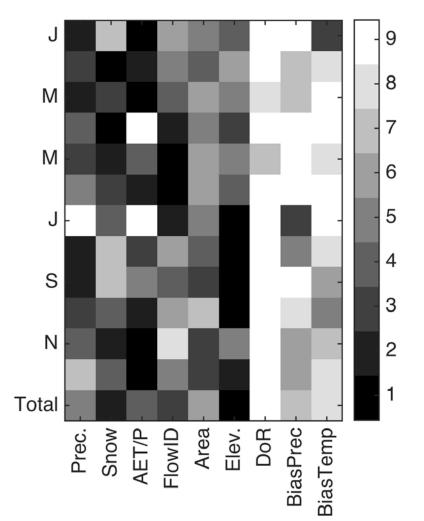

CART analysis

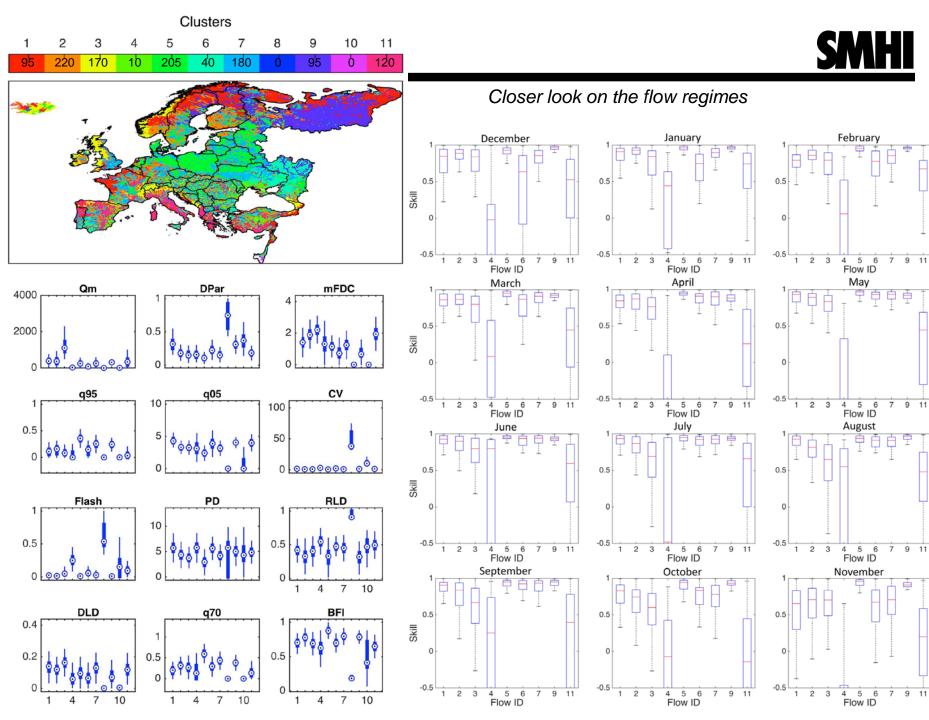

Ranking the descriptors based on their importance (with 1 being the most important)

Lead month: 0

Lead month: 2

SMHI

The evaluation spots the strengths and weaknesses of ensemble seasonal forecasts from ECMWF System 4 (15 members), including trends of performance in various months and lead times.

We identified links between forecasting skill and different physiographic and hydro-climatic characteristics.

- Forecasting skill in central/northern Europe (depending on month); however skill deteriorates as a function of lead time (i.e. Mediterranean).
- CART shows that skill is dependent on the basin's hydrologic regime.
 Elevation and remaining bias in temperature were also identified (dependence of response at mountainous basins to temperature).
- □ Skill seems to be limited at relatively flashy basins experiencing strong flow dynamics over the year (less memory in the system).

SMHI

- □ Can we improve the SHF skill by improving model initialisation using EOs?
 - o Initial soil moisture
 - o Snow
 - o Initial level of surface water (e.g. lakes, reservoirs)

□ How sensitive the SHF skill is when different SCF systems are considered?

- o System 4
- o GloSea5
- o ??
- □ Single model *vs* multi-modelling

This study is based on the hard work of all the researchers in hydrology at SMHI
