

# CMCC WEBINAR

April 9, 2018 - h. 3 pm CEST

## “A History of Bias in the NCAR Community Earth System Model: 20-years of Successes, Tough Choices and Persistent Problems”

**Richard Neale**

*NCAR - National Center for Atmospheric Research*

---

**Antonio Navarra** - Moderator

*Fondazione CMCC – Centro Euro-Mediterraneo  
sui Cambiamenti Climatici*

---

To investigate and model our **climate system** and its interactions with **society** to provide reliable, rigorous, and timely **scientific results**, which will in turn stimulate sustainable growth, protect the **environment**, and **develop science driven** adaptation and **mitigation policies** in a **changing climate**

## MISSION

# NETWORK

**ASC**

Advanced Scientific  
Computing

**CSP**

Climate Simulation  
and Prediction

**ECIP**

Economic Analysis of  
Climate Impacts and Policy

**IAFES**

Impacts on Agriculture, Forest  
and Ecosystem Services

**ODA**

Ocean Modelling  
and Data Assimilation

**OPA**

Ocean Predictions  
and Applications

**RAAS**

Risk Assessment and  
Adaptation Strategies

**REMHI**

Regional Models and  
Hydrogeological Impacts

**RESEARCH  
DIVISIONS**

# TOPICS

Modelling  
Policy Adaptation  
Agriculture Society  
Predictions Impacts  
Hydrogeology  
Forests Simulations  
Oceans Ecosystems  
Computing  
Services

**Publications**

**Events**

**Education**

**Communication**

**OUTREACH**

# Q&A session

To participate in the Q&A Session, please use the chat room provided by the Go-to-Webinar system

# A History of Bias in the NCAR Community Earth System Model (CESM):

20-years of Successes, Tough Choices and Persistent Problems

**Rich Neale**

*National Center for Atmospheric Research  
Purdue April 2018*

with Cecile Hannay, Julio Bacmeister, Andrew Gettelman, Dennis Shea,  
and many, many others...

Community Earth System Model **CESM**

# Climate Modeling Philosophy

**“all models are wrong, but some are useful.”**

*“Since all models are wrong the scientist cannot obtain a “correct” one by excessive elaboration. On the contrary following William of Occam he should seek an economical description of natural phenomena. Just as the ability to devise simple but evocative models is the signature of the great scientist so overelaboration and overparameterization is often the mark of mediocrity.”*

*George Box, Statistician*

Oh dear...

# Climate Modeling Complexity

## **NCAR Community Earth System Model (CESM)**

- CESM complexity has increased dramatically in the last 10 years
- New science, improved/missing processes
- New interactions and new constraints (and old constraints!)
- Previous improvements cannot be lost (got them for the wrong reasons?)
- CESM2 development has encountered problems with most of the above!

# Assessing NCAR models

## Is CESM2 a better model than CESM1? Is CESM2 better than all previous models?

- Summarize NCAR atmosphere models over the last 35 years
- How have we improved in the last 20 years
  - **Clear monotonic Improvements**
  - **Persistent biases**
  - **Ups and downs in skill**
  - **Trade-offs**
- Mean climate
- Variability (mostly tropical)
- Compare atmosphere-only and fully coupled configurations
- Development challenges of a complex system **CESM2**

# Paleo Climate Model Timeline

NCAR1/2/3

Release	Atmosphere	Coupled
1982	CCM0a	
1983	CCM0b	
1987	CCM1	
1993	CCM2	
1998	CCM3	CSM1/CCSM1
2002	CAM2	CCSM2
2004	CAM3	CCSM3
2010	CAM4	CCSM4
2011	CAM5	CESM1
2018	CAM6	CESM2

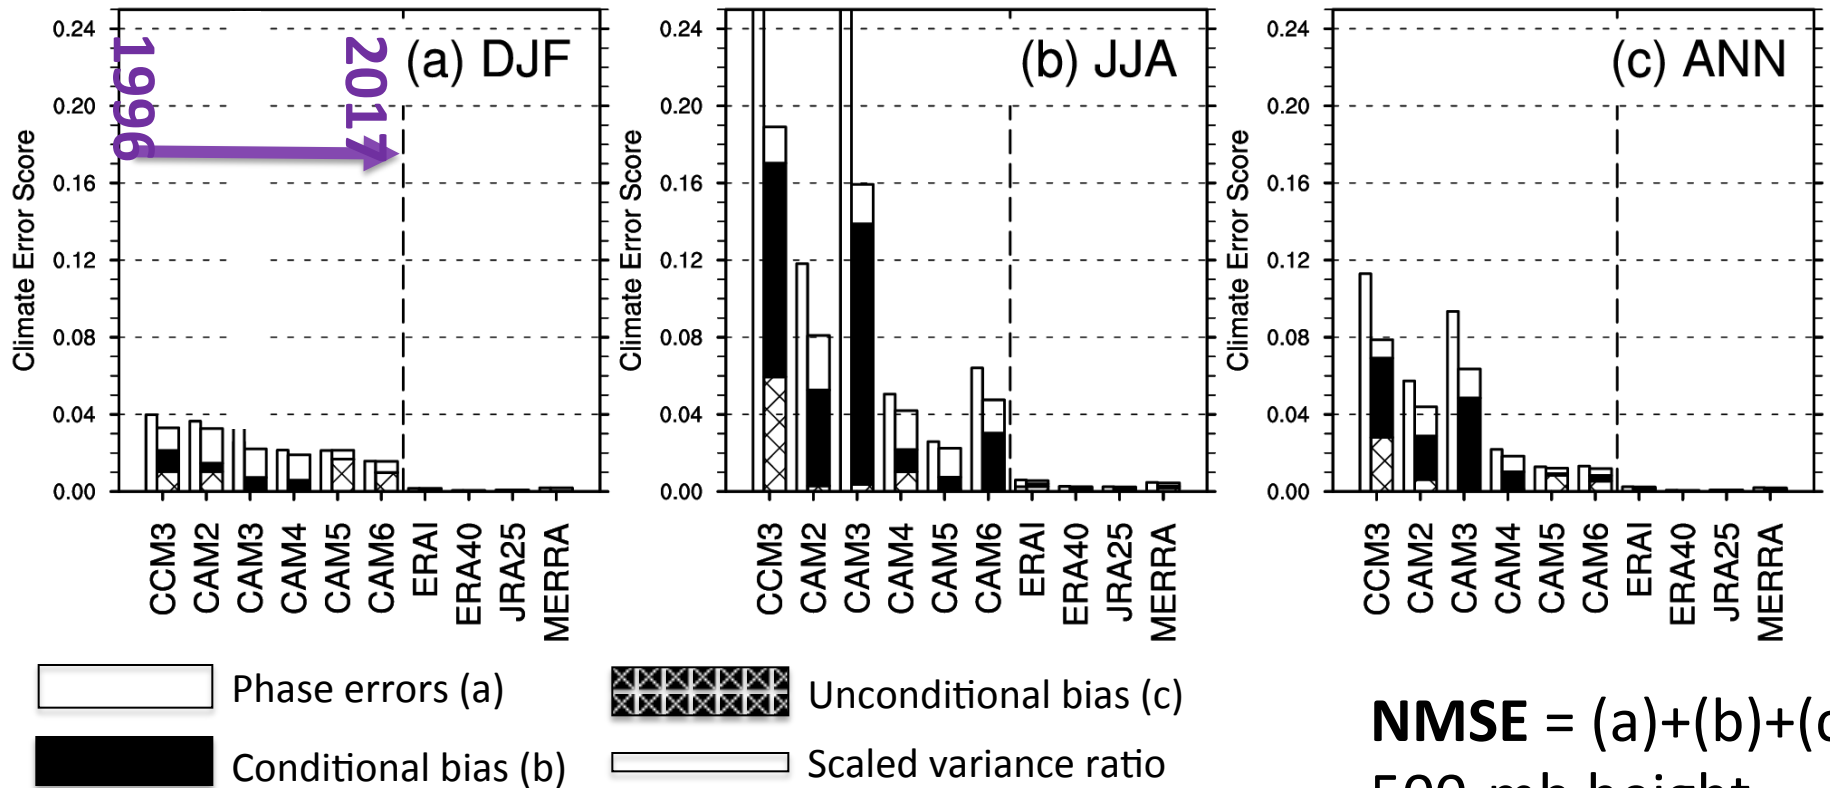

## Simulations

- AMIP: 1979-1999 (1996)
- Coupled: 20-30 years  
1850 (CCSM2, 1990)
- Annual/DJF/JJA
- Daily output

**CCM** – Community Climate Model  
**CAM** – Community Atmosphere Model  
**CCSM** – Community Climate System Model  
**CESM** – Community Earth System Model

Variability

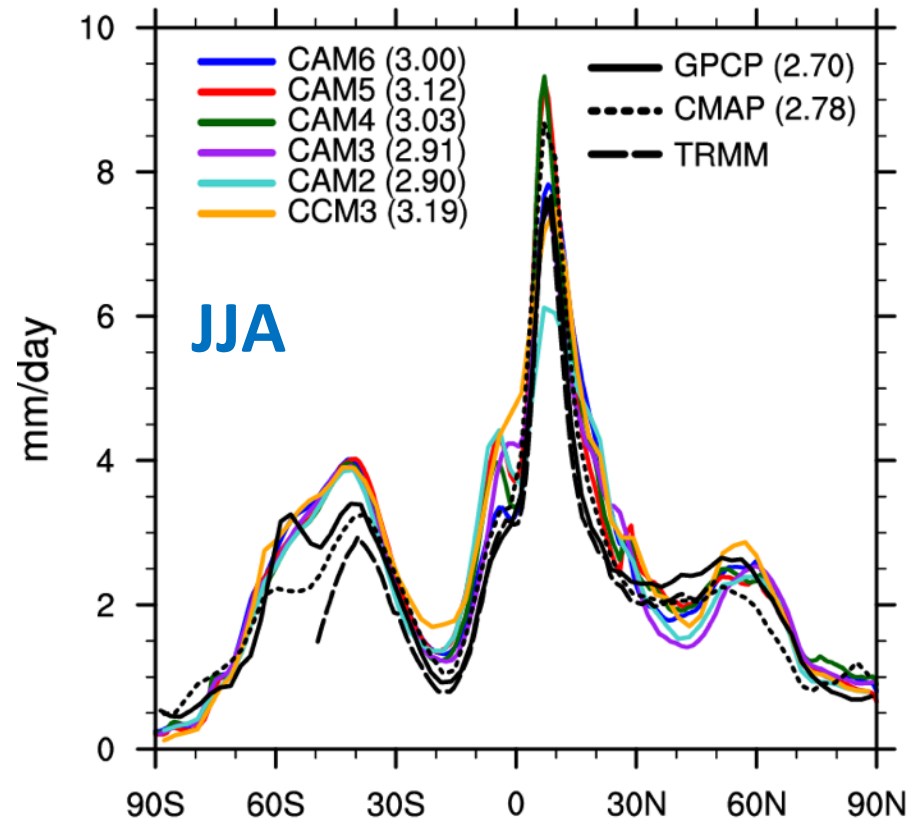

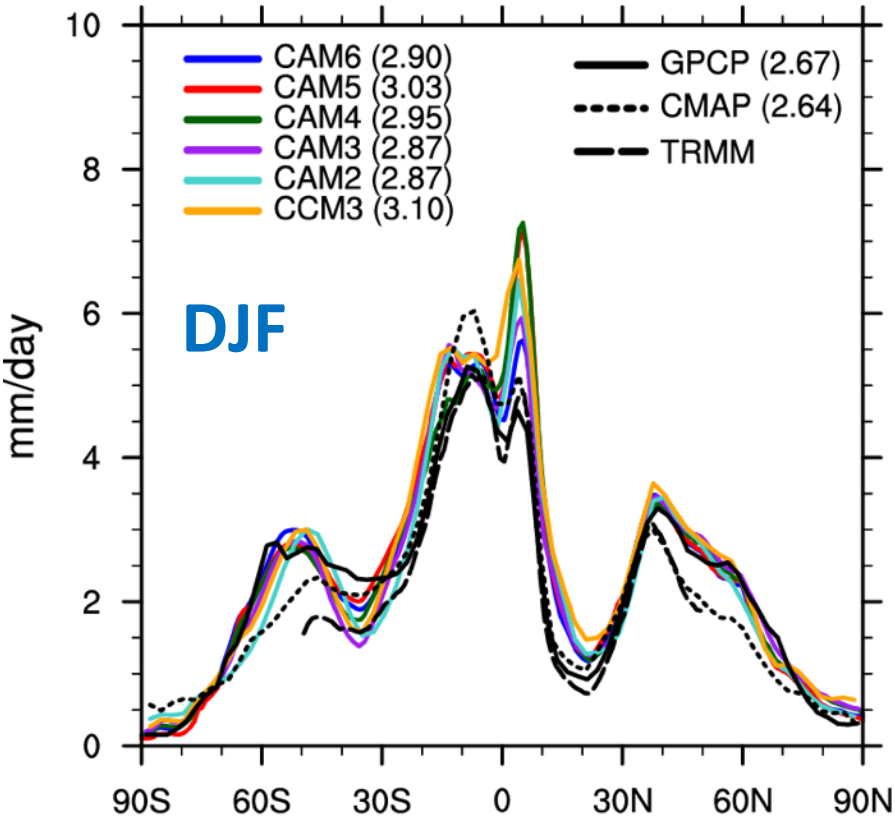

# Have we Improved? – AMIP

**NMSE = (a)+(b)+(c)**  
 500-mb height  
 Nhem (30-80 deg)

- Winter: Well simulated (baroclinic activity) with monotonic improvement
- Summer: Larger biases (unconditional, lag-regression), land dependencies

# Precipitation – Seasonal - AMIP

— CAM6  
— CAM5  
— CAM4  
— CAM3  
— CAM2  
— CCM3

- Mean precipitation ( $\bar{}$ ) is always too large
- Distributions have always been *reasonable*
- Good, long-term, global observations remain a challenge (and they change!)

# Precipitation – Seasonal - AMIP

— CAM6  
— CAM5  
— CAM4  
— CAM3  
— CAM2  
— CCM3

- DJF N. Hem ITCZ bias came, went, came, went
- S. Hem barely improved (SPCZ/Australia)
- JJA heterogeneous (monsoons)
- ITCZ width bias
- NH Extra-trop. Storm-track dry bias

# Precipitation – Seasonal - DJF

— CAM6  
— CAM5  
— CAM4  
— CAM3  
— CAM2  
— CCM3

- 'Equivalent' biases at different latitude in coupled models
- SPCZ a coupled bias. CESM2 much improved
- Different N. Hem ITCZ Skill evolution
- High latitude biases very similar

— CESM2  
— CESM1  
— CCSM4  
— CCSM3  
— CCSM2

# Short Wave Cloud Forcing (Annual) - AMIP

- Shift of biases from tropics to higher-latitudes.
- Microphysics has large impact
- Sub-tropical strato-Cu recent bias

Ave. = 47.07 RMSE = 51.37 Min. = 0.00 Max. = 0.00

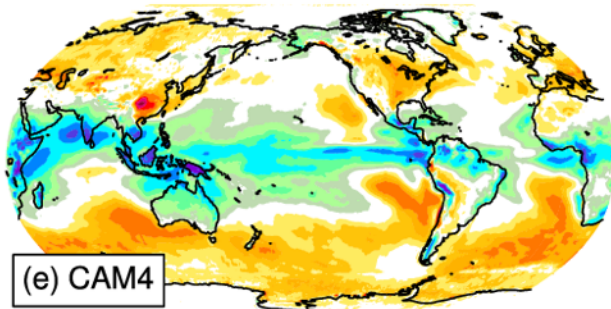

Ave. = -1.82 RMSE = 13.68 Min. = -61.41 Max. = 81.11

Ave. = -7.45 RMSE = 15.33 Min. = -74.12 Max. = 74.57

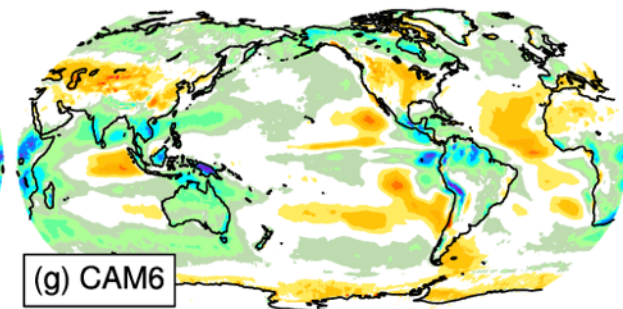

Ave. = -1.02 RMSE = 13.87 Min. = -74.10 Max. = 60.58

Ave. = -0.78 RMSE = 11.59 Min. = -71.93 Max. = 81.84

Ave. = -2.69 RMSE = 9.58 Min. = -73.26 Max. = 55.11

# Long Wave Cloud Forcing (Annual) - AMIP

- No significant improvement with time
- Shift of sign, and excessive values from low to higher latitudes
- More ambitious microphysics

Ave. = -29.90 RMSE = 32.51 Min. = 0.00 Max. = 0.00

Ave. = -0.64 RMSE = 7.54 Min. = -50.95 Max. = 31.66

Ave. = 0.69 RMSE = 8.85 Min. = -45.91 Max. = 42.55

Ave. = -4.21 RMSE = 8.29 Min. = -57.20 Max. = 31.96

Ave. = -8.39 RMSE = 10.14 Min. = -59.12 Max. = 34.86

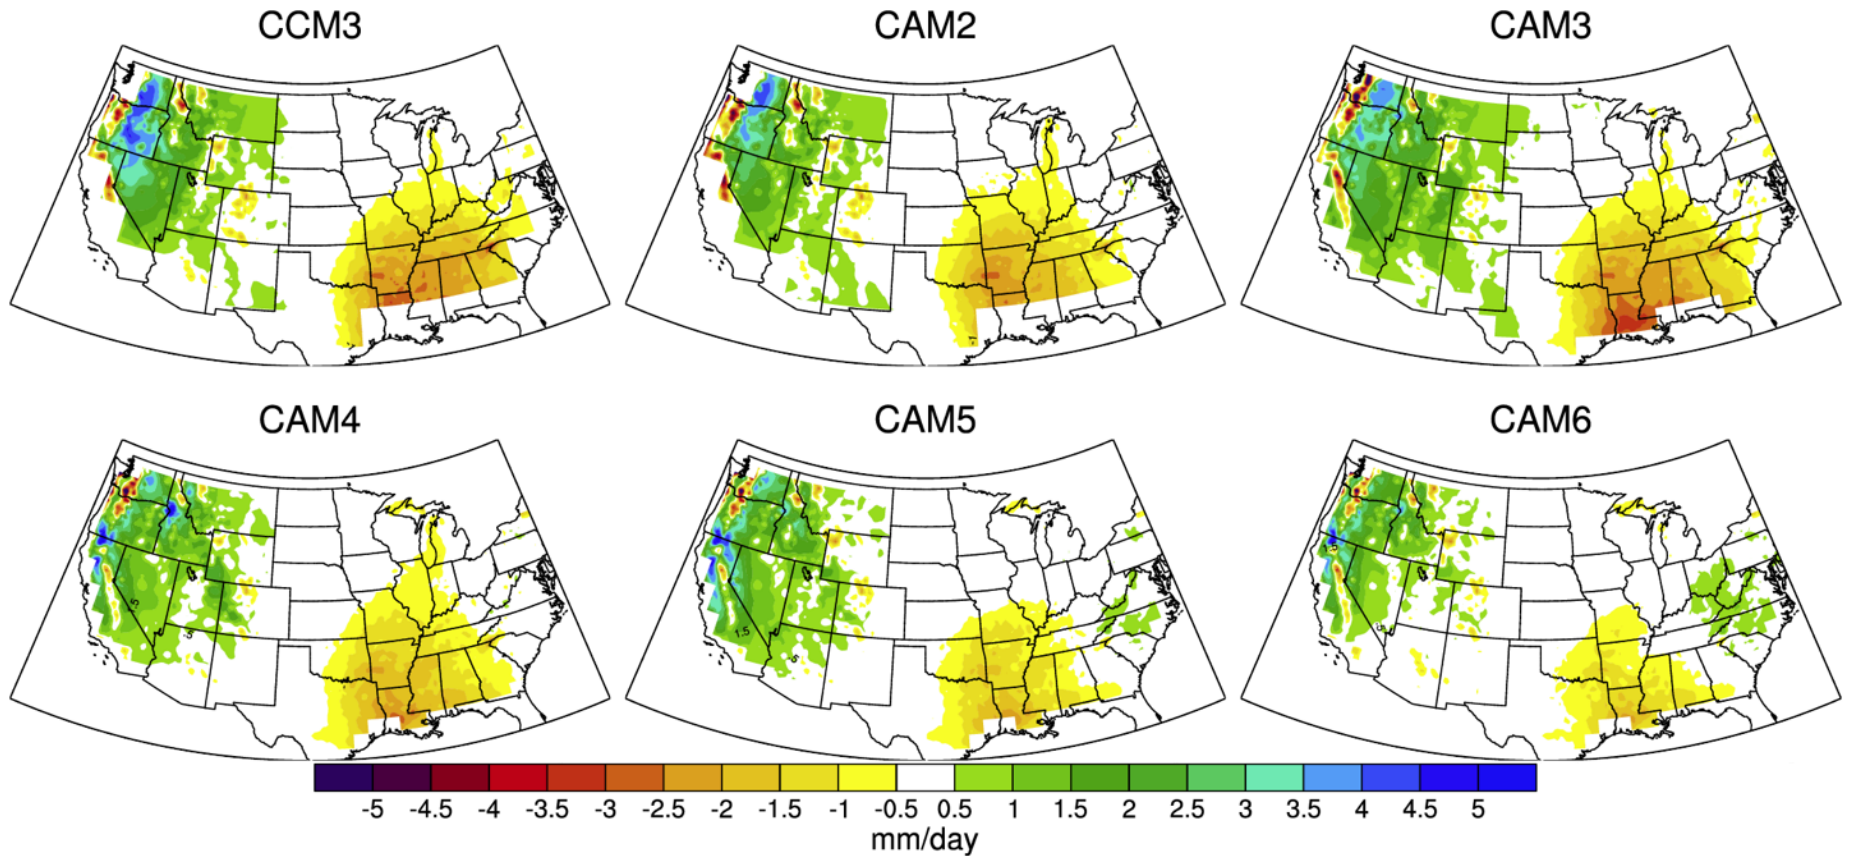

Ave. = -5.43 RMSE = 8.02 Min. = -59.37 Max. = 17.11

# RMSE Skill Scores (Annual) - AMIP

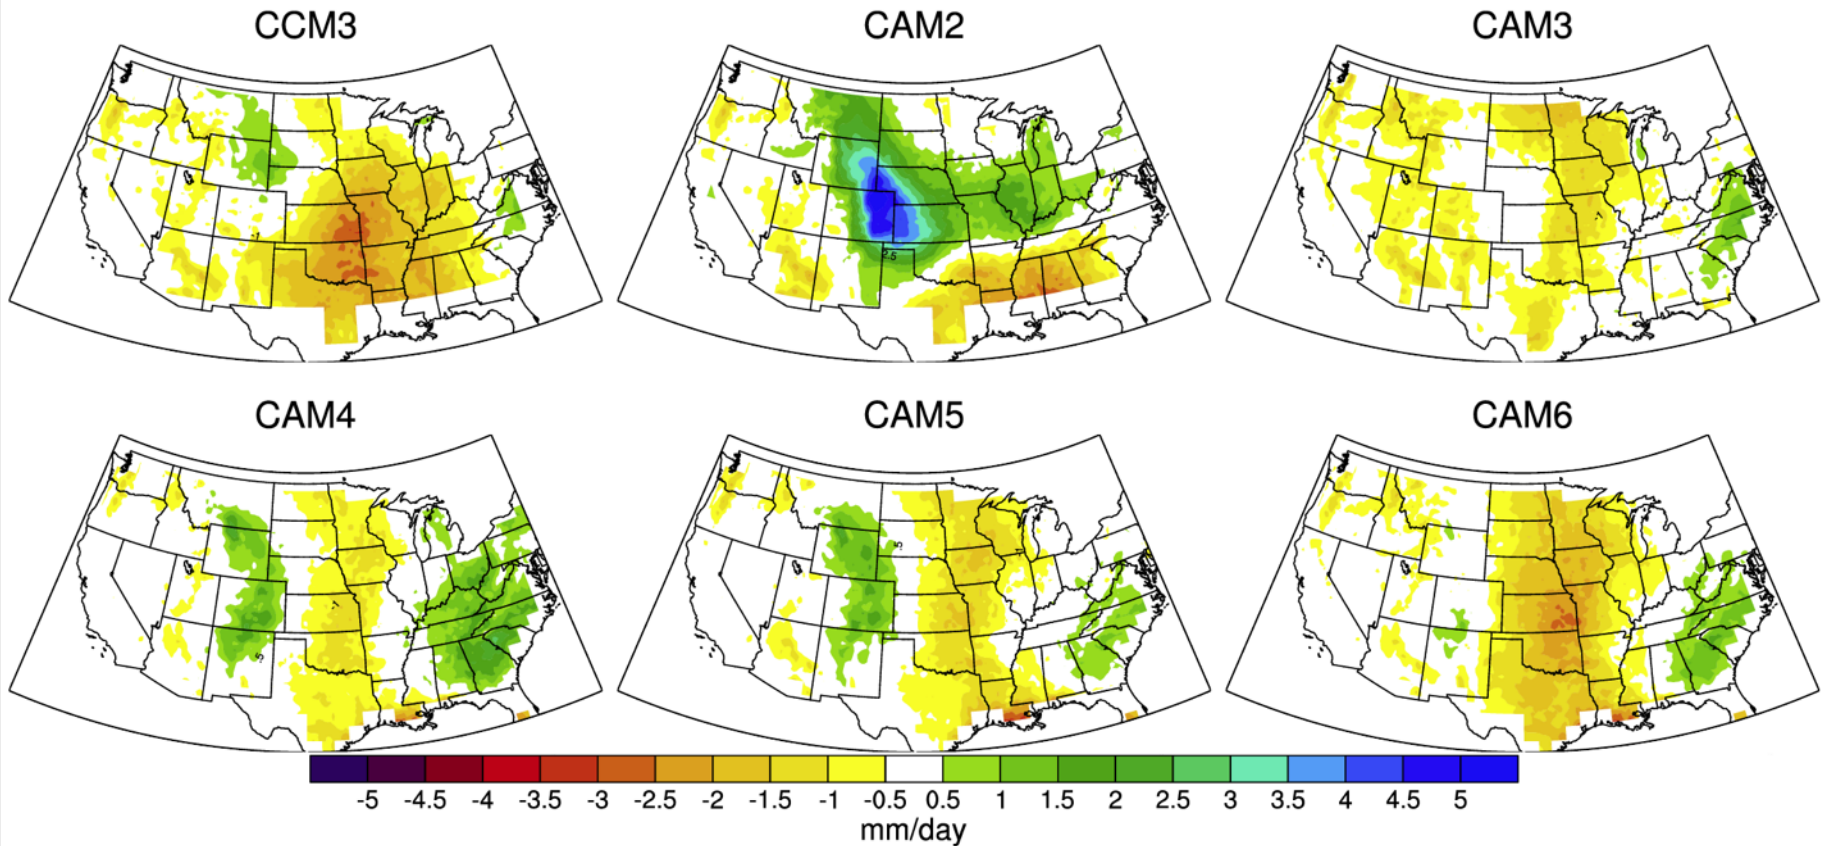

Variable	CCM3	CAM2	CAM3	CAM4	CAM5	CAM6
Precipitation	1.33	1.17	1.17	1.09	1.06	0.87
500-mb Temperature	1.72	1.61	1.12	0.59	0.90	1.03
850-mb Temperature	1.73	1.19	1.03	1.02	1.04	1.36
200-mb Temperature	4.16	4.92	3.63	3.08	3.34	2.14
200-mb Zonal Wind	3.81	4.31	3.68	2.14	1.64	2.52
850-mb Zonal Wind	1.79	2.27	1.99	1.55	0.95	1.37
500-mb Height	38.80	27.67	31.64	15.14	14.06	23.60
Surface Zonal Stress	0.033	0.038	0.031	0.021	0.020	0.019
SW cloud forcing	-	13.68	15.33	13.87	11.59	9.58
LW cloud forcing	-	7.54	8.85	8.29	10.14	8.02

# US Precipitation (DJF minus CPC) - AMIP

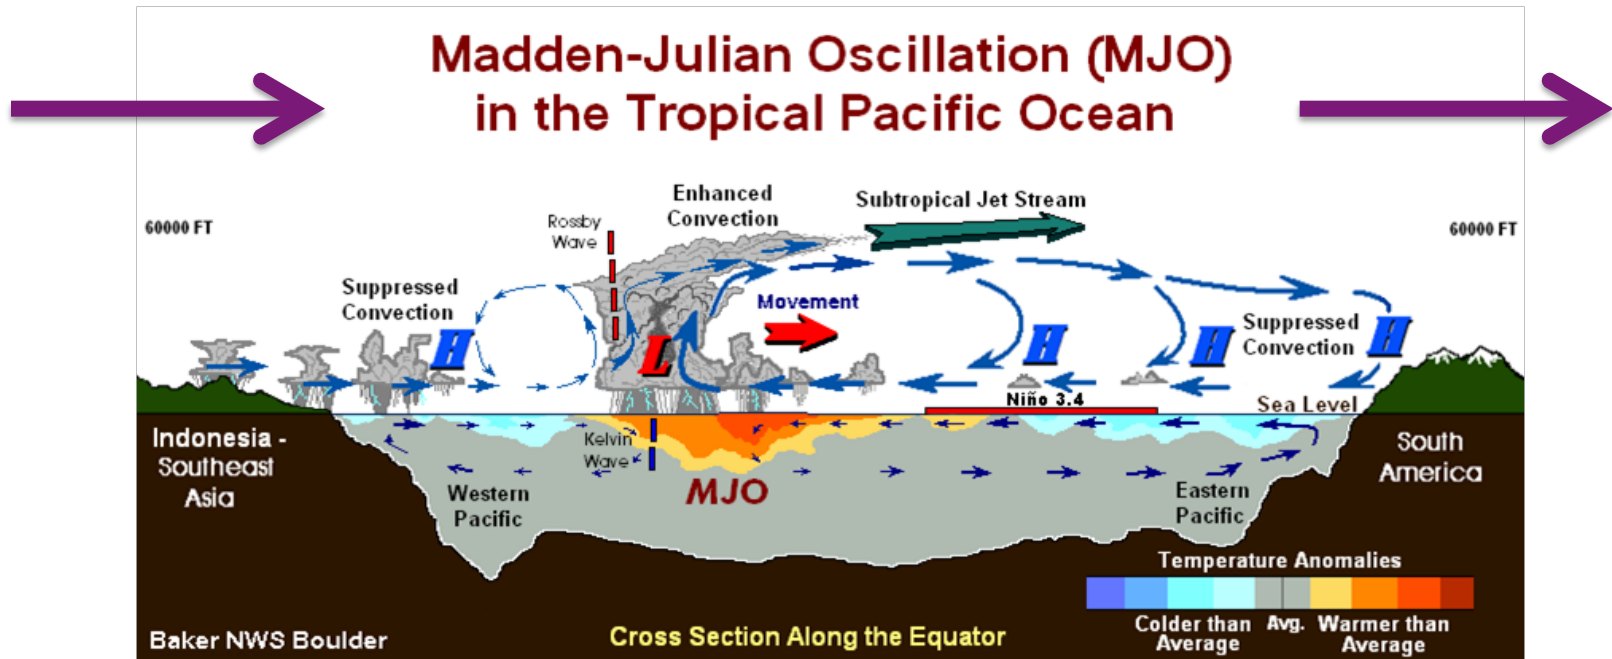

- Persistent biases across USA
- Bias halved in South-East and North West
- Reflects DJF improvements in general

# US Precipitation (JJA minus CPC) - AMIP

- Mid-west biases/Colorado have changed over time (JJA in general)
- Recent persistent biases over mid-west have worsened
- Deficient deep convection
- Lack of organization representation (resolution)

# The Madden Julian Oscillation (MJO)

- Dominant large-scale east-ward mode of variability on intraseasonal (20-100 day) timescales in the tropics – strongest in winter-time
- Convection organizes in Indian Ocean propagates into the Pacific
- Multiple interactions: ENSO, Monsoons, North Pacific wave propagation, NAO
- Potential to extend predictability to multiple weeks
- **Emergent phenomenon**

# Summary of CAM MJO performance

Combined EOF (OLR, u850,  
u200, daily BP filtered  
20-100d)

## **CAM3**

Low convective  
entrainment

## **CAM4**

High entrainment =  
moisture sensitivity

## **CAM5**

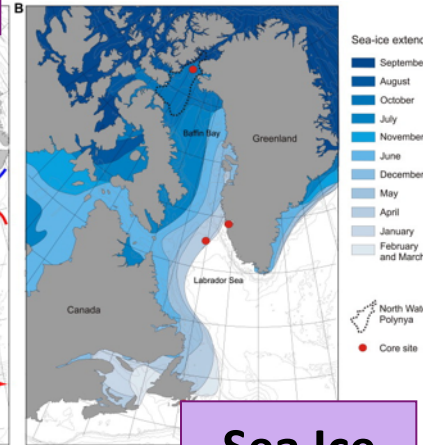

Convective retuning +  
changed params.

## **CAM6**

Increased stability sens.  
+ coupling + new  
params

# Challenges of Development: Labrador Sea

**Ocean Currents**

**Sea Ice**

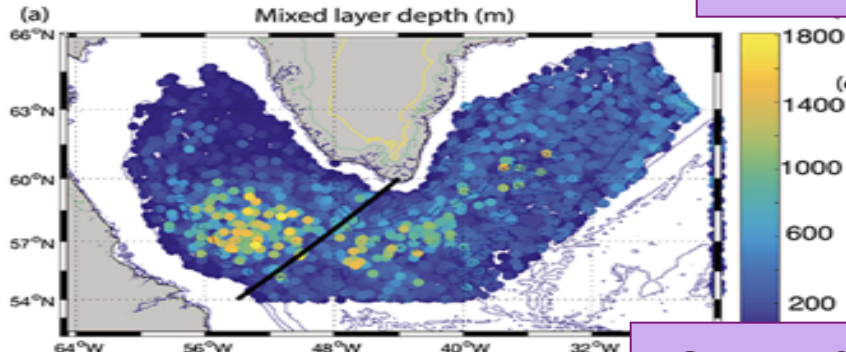

**Atmos. Circulation**

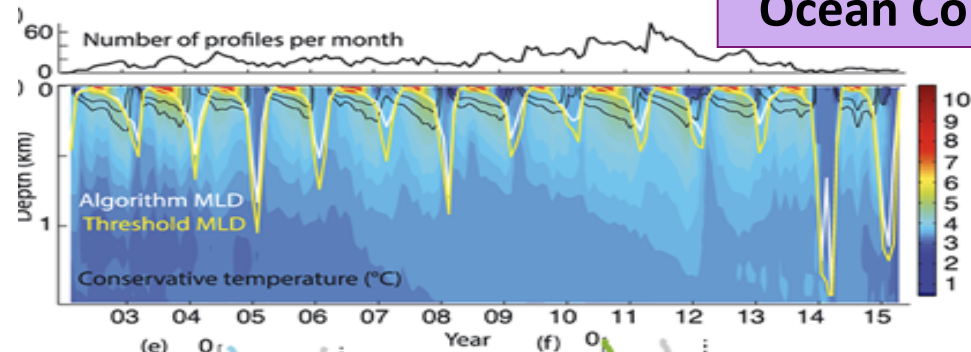

**Labrador Sea**

**Melt Water**

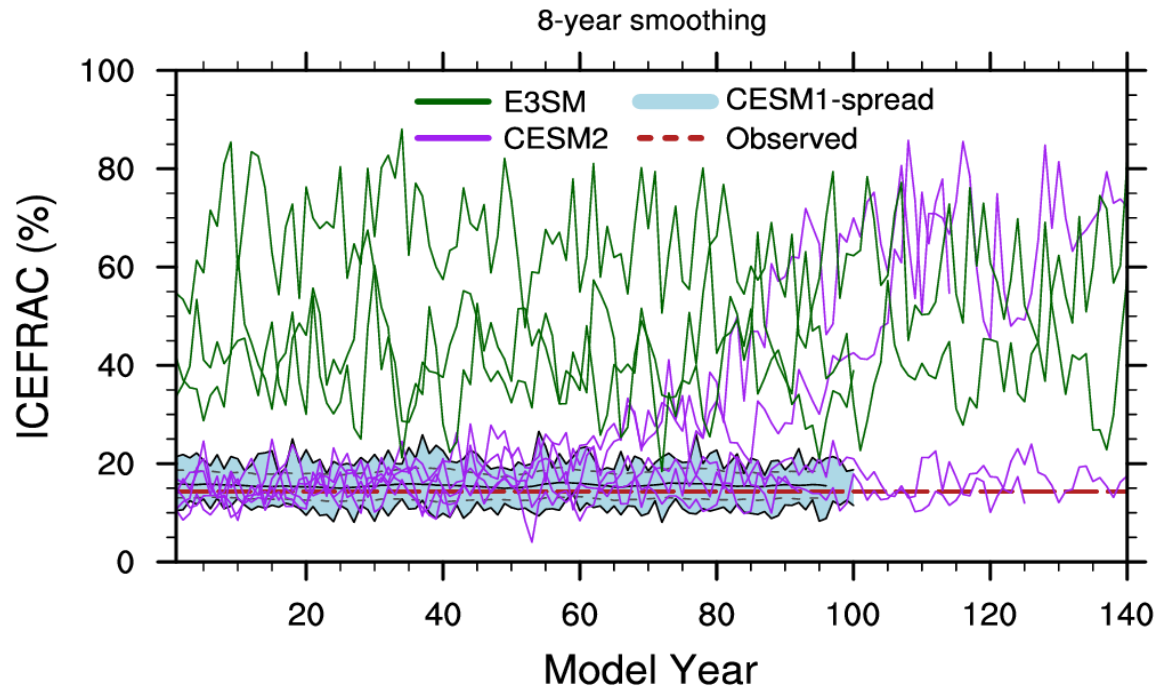

**Ocean Convection**

# Challenges of Development: Labrador Sea

# Challenges of Development: Forcing Datasets

$\Delta$ SWCF ( $\text{Wm}^{-2}$ )

CMIP5

CMIP6/CMIP6

- Competing cloud forcings and feedbacks
- Cloud sensitivities (accretion/Bergeron/autoconversion)
- Emission peculiarities in CMIP6

Thanks:  
*Andrew*

# 35 years of improvements?

## Total Precipitation Difference (ANN)

Components  
Atmosphere

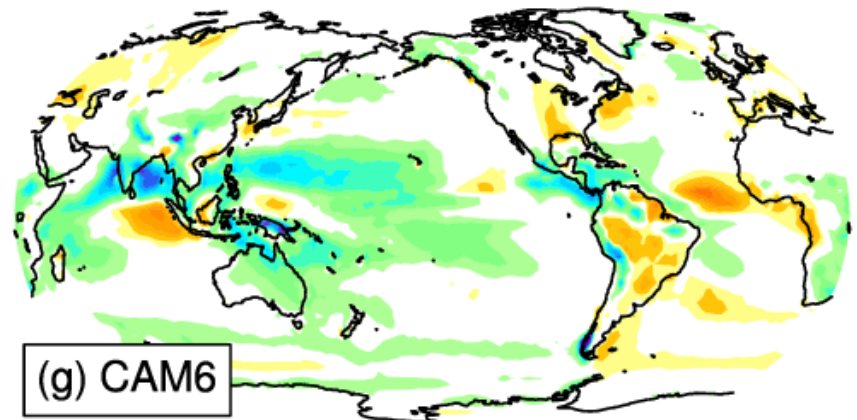

<u>Components</u>	
Atmosphere	Chemistry
Land	Bio-geo-chem
Ocean	Land-ice
Sea-ice	Paleo
WACCM	<i>Maintenance</i>

Ave. = 1.06    RMSE = 1.99    Min. = -9.61    Max. = 11.52

1982

Ave. = 0.23    RMSE = 0.87    Min. = -3.47    Max. = 7.95

2017

# Assessing NCAR Atmosphere Models

## How have we improved in the last 20 years? Next 20 years?

- Clear monotonic improvements (DJF)
- Persistent biases
- New biases begin and old biases return
- Ups and downs in skill (JJA)
  
- Trade-offs (within and across components)
- Human bias, value judgements (I like tropical clouds, other people like stress)
  
- Future looks challenging
- Mounting requirements and constraints
- Making sure things don't get worse!

# Climate Modeling Climate

**“all models are wrong, but some are useful.”**

**“some models are more wrong than others, but some are more useful than others”**

**Questions?**

Thank you for attending this CMCC webinar.

This webinar was recorded and will be uploaded to the CMCC website: [www.cmcc.it](http://www.cmcc.it)

If you have any further question about the webinar, please email: [webinar@cmcc.it](mailto:webinar@cmcc.it)
